

Movable incinerator for chicken influenza

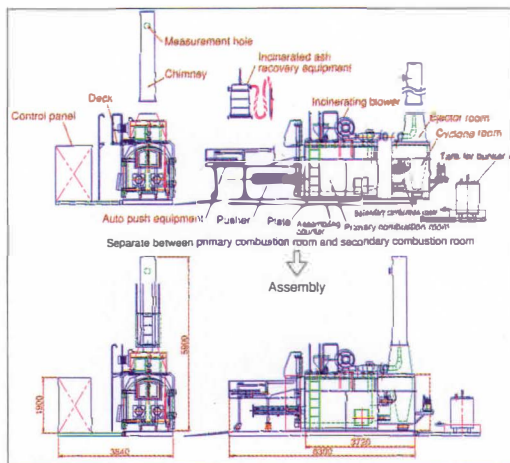

QUEMA DORA 21

- The incineration processing can be done on the generated site without moving infected chickens when the chicken influenza has generated.

This is an incinerator of the decomposition, the migration and the local assembled type corresponding to the chicken influenza which is generating all over the world.
 Since infected chickens are not moved from the generated site, the virus dissemination can be prevented.
 By decomposing, weight can be dispersed and is able to move by two ten-ton tracks.
 Therefore it is possible to carry in narrow roads such as in mountain area and also into the poultry farm that has the weight limits bridge.
 By high-efficiency combustion of reverse combustion, afterburning and high combustion system, which is proven measure by BSE incinerator, it requires much less fuel consumption.
